

・ 3項間型① - 2実解をもつとき - $p a_{n+2} + q a_{n+1} + r a_n = 0$

$p x^2 + q x + r = 0$ の解を α, β とし

$$\begin{cases} a_{n+2} - \alpha a_{n+1} = \beta (a_{n+1} - \alpha a_n) \\ a_{n+2} - \beta a_{n+1} = \alpha (a_{n+1} - \beta a_n) \end{cases}$$

と変形して④等比型へ

例A $a_{n+2} - 5a_{n+1} + 6a_n = 0$, $a_1 = 0$, $a_2 = 1$

(解法1)

$$\begin{cases} a_{n+2} - 2a_{n+1} = 3(a_{n+1} - 2a_n) \cdots \textcircled{1} \\ a_{n+2} - 3a_{n+1} = 2(a_{n+1} - 3a_n) \cdots \textcircled{2} \end{cases} \quad \leftarrow \begin{array}{l} \text{等比型} \\ \text{○, □ の求め方 (計算用紙に)} \\ a_{n+2} \rightarrow x^2, a_{n+1} \rightarrow x, a_n \rightarrow 1 \text{ とし} \\ x^2 - 5x + 6 = 0 \\ \therefore x = 2, 3 \end{array}$$

①より

$$\begin{aligned} \{a_{n+1} - 2a_n\} &\text{は } a_2 - 2a_1 = 2 \text{ の等比数列} \\ a_{n+1} - 2a_n &= (a_2 - 2a_1) \cdot 3^{n-1} \\ &= 2 \cdot 3^{n-1} \cdots \textcircled{3} \end{aligned}$$

②より

$$\begin{aligned} \{a_{n+1} - 3a_n\} &\text{は } a_2 - 3a_1 = -2 \text{ の等比数列} \\ a_{n+1} - 3a_n &= (a_2 - 3a_1) \cdot 2^{n-1} \\ &= -2^{n-1} \cdots \textcircled{4} \end{aligned}$$

③-④より

$$a_n = 3^{n-1} - 2^{n-1}$$

例A $a_{n+2} - 5a_{n+1} + 6a_n = 0$

Q なぜ, $a_{n+2} - \alpha a_{n+1} = \beta (a_{n+1} - \alpha a_n)$ と変形できるのか?

$$a_{n+2} - (\alpha + \beta) a_{n+1} + \alpha \beta a_n = 0$$

よて

$$\begin{cases} \alpha + \beta = 5 \\ \alpha \beta = 6 \end{cases}$$

解と係数の関係より

$$x^2 - 5x + 6 = 0 \quad \leftarrow a_{n+2} \rightarrow x^2, a_{n+1} \rightarrow x, a_n \rightarrow 1 \text{ とした式}$$

の2実解が α, β になる。

例A $a_{n+2} - 5a_{n+1} + 6a_n = 0 \cdots \textcircled{1}$, $a_1 = 0$, $a_2 = 1$

(解法2)

$$a_n = A \cdot 2^n + B \cdot 3^n \quad \leftarrow \begin{array}{l} x^2 - 5x + 6 = 0 \\ \therefore x = 2, 3 \end{array}$$

と仮定し、確かにこれは①を満たす。

$a_1 = 0$, $a_2 = 1$ より

$$\begin{cases} 2A + 3B = 0 \\ 4A + 9B = 1 \end{cases}$$

$$\therefore A = -\frac{1}{2}, B = \frac{1}{3}$$

よて

$$\begin{aligned} a_n &= -\frac{1}{2} \cdot 2^n + \frac{1}{3} \cdot 3^n \\ &= -2^{n-1} + 3^{n-1} \end{aligned}$$
