

・ 3項間型② - 重解をもつとき - $P a_{n+2} + q a_{n+1} + r a_n = 0$

$Px^2 + qx + r = 0$ の解を α (重解) とし

$$a_{n+2} - \alpha a_{n+1} = \alpha (a_{n+1} - \alpha a_n)$$

と変形して ④ B 指数型②へ

④ B $a_{n+2} - 4a_{n+1} + 4a_n = 0$, $a_1 = 0$, $a_2 = 1$

(解法1)

$$a_{n+2} - 2a_{n+1} = 2(a_{n+1} - 2a_n) \quad \leftarrow \text{※ 変形}$$

よて

$$\{a_{n+1} - 2a_n\} \text{は } \textcircled{1} a_2 - 2a_1 \textcircled{2} 2 \text{ の等比数列}$$

$$a_{n+1} - 2a_n = (a_2 - 2a_1) \cdot 2^{n-1} \\ = 2^{n-1}$$

○, □ の求め方 (計算用紙に)
 $a_{n+2} \rightarrow x^2, a_{n+1} \rightarrow x, a_n \rightarrow 1$ とし
 $x^2 - 4x + 4 = 0$
 $\therefore x = 2$

つまり

$$a_{n+1} = 2a_n + 2^{n-1} \quad \leftarrow \text{④ B 指数型② に帰着}$$

両辺を 2^{n+1} でわって

$$\frac{a_{n+1}}{2^{n+1}} = \frac{a_n}{2^n} + \frac{1}{4}$$

$$\frac{a_n}{2^n} = b_n \text{ とおくと } \leftarrow \frac{a_{n+1}}{2^{n+1}} = b_{n+1}$$

$$\begin{cases} b_{n+1} = b_n + \frac{1}{4} \\ b_1 = \frac{a_1}{2^1} = 0 \end{cases} \quad \leftarrow \text{④ 等差型に帰着}$$

よて

$$b_n = 0 + (n-1) \cdot \frac{1}{4} \\ = \frac{1}{4}(n-1)$$

よて, $\frac{a_n}{2^n} = b_n$ より

$$a_n = 2^n \cdot b_n \\ = 2^n \cdot \frac{1}{4}(n-1) \\ = (n-1) \cdot 2^{n-2}$$

④ B $a_{n+2} - 4a_{n+1} + 4a_n = 0 \cdots \textcircled{1}$, $a_1 = 0$, $a_2 = 1$

(解法2)

$$a_n = (An + B) 2^n \quad \leftarrow \begin{cases} x^2 - 4x + 4 = 0 \\ \therefore x = 2 \end{cases}$$

よて、正確さにこれは①を代入する。

$$a_1 = 0, a_2 = 1 \text{ より}$$

$$\begin{cases} 2(A+B) = 0 \\ 4(2A+B) = 1 \end{cases}$$

$$\therefore A = \frac{1}{4}, B = -\frac{1}{4}$$

よて

$$a_n = \left(\frac{1}{4}n - \frac{1}{4}\right) \cdot 2^n \\ = (n-1) \cdot 2^{n-2}$$
